Abstract

The unemployment protection systems that exist in most Latin American economies are generally considered inadequate in terms of providing insurance to workers. They may also encourage stratified labor markets and impose barriers to the employee's mobility and the firm's adjustment to changing labor market conditions. In addition, some of these systems involve high administrative and monitoring costs and may create additional adverse effects that induce higher unemployment rates and longer duration of unemployment and promote informal labor markets. Recently, research effort and policy interest has turned to Unemployment Insurance Savings Accounts (UISAs) as an alternative to traditional systems of unemployment insurance. UISAs are schemes of individual mandatory savings. Therefore, they smooth income over an individual's life cycle time rather than pooling unemployment risk over the total working population at a point in time. This form of unemployment insurance diminishes the moral hazard problems associated with traditional insurance methods. However, it presents problems of its own. First, it is questionable that these systems provide adequate protection against unemployment risk. Additionally, their effects on the promotion of informal labor markets and their administrative costs are yet to be determined. Finally, the effectiveness as a form of unemployment insurance depends critically upon the performance and credibility of the financial institutions managing the funds. This paper examines the experience of Latin American countries that use UISAs, with the hope of highlighting the problems of the system and identifying areas for future theoretical and empirical work. In conclusion, the overall effect of UISAs depends on a vast array of specific country characteristics and program parameters. The way the system is implemented, existing labor regulation, the extent of the informal economy and the scope for collusive behavior greatly influence the success of these programs. This calls for a more extensive research effort in the area.

Unemployment Insurance Savings Accounts in Latin America: Overview and Assessment

Ana M. Ferrer and W. Craig Riddell*

1. Introduction

A variety of economic shocks have hit Latin American countries since the end of the 1990's. The effects of these shocks upon the labor market have been severe and have re-awakened a long standing debate between the need for employment stability and the need for flexible labor markets. For firms, extensive labor regulation implies a costly adjustment to economic changes, loss of competitiveness and slower economic recoveries.¹ On the other hand, in the absence of adequate mechanisms of income support, flexible labour markets leave workers unprotected to face economic downturns. Additionally, poor labor stability may have undesirable effects on human capital accumulation and labor productivity.

Many Latin American countries seek in labour market flexibility a way out of the current financial difficulties. In these circumstances, providing adequate income support for the affected workers becomes most important. Traditionally, most Latin American countries have protected the unemployed through a combination of high severance payments and/or low unemployment insurance or subsidies. Both theoretical and empirical research shows that these systems offer low coverage, benefit workers from the formal sector only, impede labor mobility and technological adjustment by the firms, and provide incentives for the creation of informal job relations.²

*The authors, Ana M. Ferrer, Department of Economics, University of British Columbia and W. Craig Riddell, Department of Economics, University of British Columbia would like to thank Milan Vodopivec and a referee for their comments on an earlier version of this paper. The findings, interpretations, and conclusions expressed in this paper are entirely those of the authors. They do not necessarily represent the view of the World Bank, its Executive Directors, or the countries they represent.

¹ The effects of labor market regulation on various aspects of employment and unemployment in Latin America have been studied by Barros and Corseuil (2001), MacIsaac and Rama (2000), Mondino and Montoya (2000), Saavedra and Torero (2000), and Marquez and Pages (1998).

² See Heckman and Pages (2000), Blanchard (1998), Blondal and Pearson (1995), and Katz and Meyer (1990).

The unemployment protection systems that exist in most Latin American economies are generally considered inadequate in terms of providing insurance to workers and are prone to generate stratified labor markets. Recently, research effort and policy interest has turned to Unemployment Insurance Savings Accounts (UISAs) as an alternative to traditional systems of unemployment insurance. UISAs are schemes of individual mandatory savings that smooth income over an individual's life cycle time rather than pooling unemployment risk over the total working population at a point in time. Although this form of unemployment insurance diminishes the moral hazard problems associated with traditional insurance methods, it presents problems of its own. This paper examines the experience of Latin American countries that use UISAs, with the hope of highlighting the problems of the system and identifying areas for future theoretical and empirical work. In conclusion, the overall effect of UISAs depends on a vast array of specific country characteristics and program parameters. The way the system is implemented, existing labor regulation, the extent of the informal economy and the scope for collusive behavior greatly influence the success of these programs. This calls for a more extensive research effort in the area.

The paper is organized as follows. Next section discusses the potential advantages of UISA's. Section 3 describes the UISA systems currently in place in Latin America and goes on to analyzing some of the issues concerning UISA's that have arisen in the light of these countries' experiences. Section 4 concludes.

Potential Advantages of UISA's

In the context of the existent high levels of unemployment in most Latin American countries, a review of the current and alternative systems of unemployment protection is called for. Recently, research effort and policy interest has turned to UISAs as an alternative to traditional systems of unemployment insurance. UISAs are schemes of mandatory savings. The basic design of these systems is as follows. Workers and/or firms are required to make regular deposits to individual accounts. In the event of unemployment, the worker can withdraw funds from his account to support the transition toward another job. This system has the advantage of making workers internalize the cost of unemployment benefits, hence

avoiding traditional moral hazard problems present in most insurance schemes. In general, this system does not affect the incentives for job search as unemployment insurance does. It has, however, potential adverse effects that have to be addressed. Theoretical studies by Orszag et al. (1999) and Stiglitz and Yun (2002) indicate that unless savings accounts are comprehensive -- that is, they become pension funds upon retirement -- workers will have incentives to withdraw from the labor force before retirement to claim their accumulated savings. These studies also suggest that, as long as the various risks faced by a given person are not perfectly correlated, integration of the social insurance programs intended to deal with these individual risks will also be welfare improving.

UISA's have been assessed against more traditional systems of unemployment insurance (UI)³. Because UISA's are individual accounts, the moral hazard problem present in UI programs vanishes. Workers fully internalize the cost of remaining unemployed and have greater incentives towards re-employment. This is an important aspect of UISA's given the limited monitoring capacity of developing countries. Because the two systems require different degrees of infrastructure, they are generally suitable for economies at different levels of development. However, most of the debate over UISA's focuses on its advantages versus severance pay, the most common form of unemployment protection in Latin America⁴. UISAs do offer some of the same advantages that severance pay does⁵. Severance pay constitutes a lump sum -- the magnitude of which usually depends on job tenure -- collected upon job separation. Consequently, it does not affect job search effort. It is also unlikely to reduce effort exerted on the job, since misconduct at work often precludes severance pay. Therefore, both UISAs and severance pay avoid moral hazard problems on the part of the worker. The main difference between both systems, however, is that severance pay creates additional moral hazard problems on the part of the firm that are not present in UISAs. Because, in the case of severance pay, payments are only made at the end of the labor contract, and may reach at the time of liquidation considerable size, firms have incentives to try to avoid payment (Kluger, 2001). Additionally, there is not, in general, a legal

³ See Vodopivec and Raju (2002)

⁴ See Parsons (2004) for a discussion of the differences between UISA's and Severance Pay income protection systems for workers permanently separated from their jobs.

requirement for the firms to maintain enough reserves to support this obligation. This creates liquidity problems when the firms need to make substantial labour adjustments. UISAs, on the other hand do not create such incentives/problems because smaller payments are made regularly to the individual accounts. Hence, the main advantage of UISAs relative to severance pay is to avoid the firm moral hazard problem and to guarantee payments to the worker in the event of unemployment. An additional distinction between the two systems is that UISAs qualifies as a delayed payment, rather than as a firing cost, which is the case of severance pay. This has important consequences in terms of creating a more flexible labor relation without lowering income protection. The same incentives that may induce a firm to avoid the payment of a large severance package may prevent it from dismissing unproductive workers or (formally) hiring additional workers.

One of the major uncertainties regarding an UISA system concerns its capacity to provide sufficient coverage and adequacy of benefits against unemployment risk. Since, in the event of unemployment, workers withdraw funds from a personal account rather than from a common pool of resources, benefits may not be adequate for individuals who experience frequent or long-lasting spells of unemployment. For this reason, UISA systems are not usually conceived as the sole form of unemployment protection. Alternatively, they may contain additional features such as limits on the withdrawal of funds or government contributions to a separate pool of funds, which would alleviate these situations. The most common theoretical proposal includes a combination of self-insurance with public insurance. In these models, workers may borrow from the government in the event that their own unemployment account balance becomes negative. Model simulations seem to offer hope that such systems will indeed be viable (Feldstein and Altman, 1998 and Vodopivec and Rejec, 2001). In line with these models, Chile has implemented a UISA system that also finances, through employer and government contributions, a common unemployment fund (Fondo Solidario). Chilean workers with insufficient balances in their accounts can borrow against the Solidarity Fund.

⁵ For an overview of the severance pay system around the world and in Latin America see Holtzman, Iyer and Vodopivec (2003) and Jaramillo and Saavedra (2005) in this volume.

An additional issue regarding the coverage of UISAs systems arises when we consider the extent of the informal economy in many Latin American countries. In general, any system that significantly increases the burden of labor costs for employers has the potential to promote informal labor contracts (Lozoya, 1996). Theoretically, UISAs are less prone than other systems to have this effect, since employers' contributions do not usually depend on the length of employment, neither are they necessarily tied to other labor costs. In practice, however, it is important to note that the effects will depend on country specific issues such as: how the UISA system is implemented, its cost relative to the previous program, and how it interacts with other labor regulations. Therefore, country specific case studies are necessary to analyze the effects of UISAs in promoting formal labor contracts.

Another dimension on which UISAs offer an advantage relative to more traditional systems is that they promise to have relatively low administrative costs. Since, in general, the funds are accessible upon any kind of separation, extensive monitoring is not needed. Additionally, the funds are deposited in individual accounts, in most cases in existent financial institutions, which also reduce managing costs. Again, the extent of this advantage depends on country specific factors. A system that combines UISAs with social insurance may still have considerable monitoring costs. In addition, if benefits are contingent upon the type of dismissal, other costs, such as litigation costs, may have to be considered.⁶ It is worth mentioning that, since funds in unemployment accounts become pension funds upon retirement, UISAs may provide a foundation for developing individual pension plans. Although this aspect may not be apparent right now, given the small size of the balances generally held in these accounts, it may prove important in the face of growing concern about the sustainability of public pension funds. As an alternative to company pension plans, UISAs have the advantage of being fully portable (therefore, not restricting worker's mobility) and not having higher administrative costs.

A final consideration with respect to UISAs involves the credibility of the institutions managing the funds. Because of the nature of the funds, workers regard them as relatively illiquid assets. In the presence of liquidity constraints, if the real return on the deposits is low, the valuation of the accumulated funds will be low as well and will diminish as the fund

⁶ This is the case in Brazil. See Camargo (2002).

accumulates. In this event, the worker's valuation of the fund will be lower than the employer's cost of the payments, which provides incentives for informal agreements that may benefit both parties. Evidence of this behavior has been documented for Brazil where workers have incentives to provoke their own dismissal in order to access the fund (Gil et. al., 2000, and Barros, Corseuil and Foguel, 1999). This type of collusive behavior is difficult to anticipate. It may originate from the lack of credibility of the institutions that are managing the funds, but also from the severity of liquidity constraints for the covered population. The particular form of collusive behavior is also likely to be country specific, depending on the interaction of the UISA system with existing labor regulations. In this context, it is worth mentioning that other institutional factors may also affect the effectiveness of the system. One example is the case of Peru, where the government has authorized several withdrawals from the individual accounts for purposes other than unemployment protection.⁷ As a result, unemployment protection has become limited or even non-existent for those workers who decide to withdraw funds. Although these measures were deemed temporary, the Peruvian government is experiencing difficulties going back to the UISA system of mandatory savings, since workers have been enjoying a form of wage increase from the "temporary" measures that it is difficult to give up.

Overall, UISAs have the potential of overcoming some of the worst features of traditional systems of unemployment protection, reducing moral hazard, lowering administrative costs (with respect to unemployment insurance), reducing firing costs and avoiding firms' liquidity issues (with respect to severance payments). Theoretically, they are also likely to promote formal labor markets. However, the system needs to be upgraded with additional features if it is to provide adequate coverage. This, in turn, may limit the advantages mentioned before. The overall effect of UISAs depends on a vast array of specific country characteristics and program parameters. Examination of the existing UISA systems is a first step in this direction. By describing the experience of Latin American countries that use UISAs, we hope to offer light on the common problems of the system and suggest possible directions for future theoretical and empirical work.

⁷ Peru, Decreto de Urgencia 67-2002 (to repay loans guaranteed with CTS) and Decreto de Urgencia 19-2002 (to incentive domestic demand).

2. Unemployment Insurance Savings Accounts in Latin America Overview

Offering an overview of UISA's in Latin America presents several challenges. It is often difficult to obtain comparable information on the performance of the institution under analysis. In the case of Latin America, some programs have been in place for a very short time (Chile, Ecuador) while others have more than ten years of history (Brazil, Colombia, Peru or Panama). In some countries, all dependent workers have the right to be covered by the system of individual accounts. Yet, in Argentina UISA's only cover construction workers. This variation across programs limits the amount of information available to researchers. Additionally, accounting methods also vary across countries, making comparisons more difficult. For instance, Brazil publishes only the number of active accounts, which may not correspond with the number of workers covered by the system, as accounts are linked to jobs rather than to individuals.

We summarize the main characteristics of UISA's and some indicators of the performance of the funds in Tables 1 and 2.

As mentioned, UISAs are mandatory savings schemes in which employers (and in the case of Chile, workers as well) contribute on a regular basis a fraction of the monthly wage towards a special individual account. In general, upon separation workers can access the totality of the funds. In all the cases examined here, the fund is available to the worker upon retirement or to the inheritors, in the case of death. Table 1 shows the main features of the UISAs in Latin America: the type of worker covered, the amount of contributions, requisites to access the funds, income protection benefits, other benefits derived from the funds, whether the system provides social insurance, and the type of institution that manages the funds. Most countries, except Argentina, Brazil and Peru, cover all dependent workers. Contributions are mostly made by employers and are generally around one month's wages per year, although they may range from one week's wages per year (Panama) to a maximum of 12% of the monthly wage in Argentina. In Chile the government makes contributions to the fund. Most countries allow employees to make voluntary contributions, whereas employee contributions are required in Chile. In terms of the pre-requisites to collect the

funds, some countries, like Brazil and Ecuador, make the payment conditional upon the type of separation. This restriction has the potential to increase monitoring and administrative costs (Camargo (2002)). It may also contribute to employer-employee collusive behavior regarding how separations are "labeled". Such behavior has been extensively documented for Brazil (Barros, Corseuil and Foguel, 1999). In addition, Chile, Ecuador and Venezuela require a minimum of contributions or tenure in order to access the funds. Regarding the amounts available in case of job separation, most countries allow access to the total balance of the fund. However, Chile and Ecuador, which have a system closer to the original unemployment insurance saving account model, limit the benefits that can be collected at one given time. This feature further reduces the incentives for collusive behavior mentioned above at the cost of increasing administrative costs.

An additional issue concerning the adequacy of the benefits arises from the severity of liquidity constraints. Since UISAs may be imposing mandatory savings on a potentially credit constrained population with perverse effects on family expenditures and investments, most programs (except Chile, Ecuador and Venezuela) allow partial withdrawals from the fund to finance human capital investments and to pay for housing or health expenses. The effect that these "exceptions" have on the insurance role of the individual funds is yet to be examined. In Peru, for instance, the increased allowances of fund withdrawal are threatening the purpose of the severance fund as a source of income protection against unemployment.

How good are UISAs in providing income protection in the event of unemployment? One of the main problems of a pure UISA system is that it forgoes the redistributive effects available with a system that pools the unemployment risks of all the working population. Because of the concentration of unemployment among certain groups of the population, UISAs may not provide adequate benefits for temporary workers or those with low incomes. This creates the problem of providing alternative sources of income for workers with insufficient funds in their accounts. Of all the countries, Chile is the only one that offers social protection within the individual account system, through the Solidary Fund. Ecuador is moving towards a system based only on individual accounts, but it is currently a mixed system, where part of the population still withdraws funds from a common pool. In other countries, additional income sources may be available from other programs.

Table 1. UISA Characteristics

Country	Coverage	Contributions	Eligibility Requirements	Unempl. Benefits	Other Benefits	Social Insurance	Funds
Argentina (1975)	Construction Workers	Employers: 12-8% m. wage	Proof of dismissal	Balance upon separation	--	NO	Banking Institution
Brazil (1989)	Dependent workers not covered elsewhere	Employers: 8% m. wage.	Contingent on type of separation	Balance upon separation.	Partial withdrawal allowed for housing or health expenses.	NO / Other Programs	Government
Chile (2002)	Dependent workers	** Employees: 0.6% m. wage Employers: 2.4% m. wage Gov. Contributions	Minimum 12 contributions	1 m./year (up to 5 m.) Decreasing benefits with min and max	--	Min. benefits guaranteed with the Solidarity Fund. (up to 2 withdrawals every 5 years)	Recognized Financial (exclusive dedication)
Colombia (1990)	Dependent workers	Employers: 9.3% m. wage.	Proof of dismissal	Balance upon separation.	Partial withdrawal allowed. Funds can guarantee some house loans	NO / Other Programs	Recognized Financial (exclusive dedication)
Ecuador (Mixed 2001)	Dependent workers	Employer: 1 m. wage / year to individual accounts (monthly contribution).	Involuntary unemployment Min 48 deposits 1 year tenure	Balance upon separation / 3 times the avg wage in previous year	--	NO / Other Programs	Recognized Financial (exclusive dedication)
Panama (1972)	Dependent workers	Employer: 1 w. wage / year + 5% compensation Employee: voluntary	Additional compensation contingent on type of separation	Balance upon separation	Partial withdrawal allowed for housing, education or health expenses	NO / risk pooling within firms	(collective fund with approved institution)
Peru (1991)	Private workers not covered elsewhere	Employers: 2 deposits of 1/2 m. wage	Proof of dismissal	Balance upon separation	50% withdrawal allowed. Additional withdrawal authorized occasionally	NO	Banking Institution
Venezuela (1997)	Dependent workers	Employer: 5 d wage/ month. Increases with tenure. Max 30 d wage/year	3 months tenure	Balance upon separation	--	NO / Other Programs	Recognized Financial Employee

** Minimum and maximum contributions

Another source of difference among countries relates to the administration of the funds. Most programs establish special financial institutions -- or create special regulations governing existing institutions -- whose sole function is the managing of the unemployment / severance fund. Other countries, like Argentina or Peru, allow the funds to be deposited in the regular banking system (and instead regulate the type of deposit). In Brazil the government operates the fund, while Panama gives the employer discretion about the choice of the managing institution. Venezuela has opted for a mixed system for the administration of the severance fund.

Table 2 offers a summary of the performance of the funds in different countries. As mentioned, some programs of very recent implementation have only limited or almost no information available (Ecuador and Chile). Other programs are limited (Argentina) and no information could be found on their operation. In some cases (Brazil), information on the number of beneficiaries is not available.

UISA's are relatively small programs in Latin America. The main exception is Chile, where after less than two years operating, 22% of the employed population has an active account. These figures fail to account for the extent of the informal economy. The average balance held in the individual accounts usually exceeds minimum monthly wages. However, this is a poor indicator of the performance of the funds in terms of income protection since, with the exception of Chile, no program guarantees minimum payments.

The rest of this section offers a detailed review of the features and operation of the UISA systems currently in place in Latin America. It also goes on to analyzing some of the issues concerning the performance of UISA's that have arisen in the context of different countries' experience.

Argentina

Argentina has a form of UISA for construction workers. The Collective Bargaining Agreement for Construction Workers in Argentina (Convenio Colectivo de la Construcción 76/75) refers to a "Fondo de Desempleo for the Construction Industry" (Unemployment Fund for Construction Industry). It establishes that employers must make monthly contributions of 12% (in the first year) and 8% (in subsequent years) of the monthly wage. These

contributions are deposited in individual accounts in banking institutions and are, presumably, available to the worker upon separation of any kind.

Brazil

The FGTS (Fundo de Garantia de Tempo do Servico) was established in 1967. The new Constitution of 1988 brought major changes to labor regulation and unemployment protection in Brazil. In particular, it established that contributions to the FGTS should be placed in individual accounts rather than into a common pool of resources. It also introduced changes in the penalty a firm must pay if it dismisses a worker without just cause. The two concepts are closely related because the penalty is set as a percentage of the value accumulated in the fund. In particular, the 1988 constitution set this penalty for dismissal without just cause from 10 to 40% of the amount accumulated in the worker's account during the length of the contract.⁸ This amount was paid directly to the worker. Additionally, in 2001, the government legislated additional social contributions to the fund in the case of dismissal without just cause. These include 10% of the deposits accumulated in the FGTS during the contract and 0.5 of the last monthly wage. The purpose of these contributions was to cover the deficit generated by a ruling of the Brazilian Supreme Tribunal of Justice that recognized the worker's right to a monetary adjustment on FGTS accounts between 1988 and 1989. Therefore, these contributions -- although part of the Fund -- do not increase worker's accounts individually.

The fund is built with contributions from the employers that amount to 8% of the employee's monthly salary⁹, roughly one month of pay per year of work. Individual accounts are associated with specific labor contracts. Therefore, there are as many accounts as labor contracts. These can be classified into two main groups:

- Active Accounts are those that receive regular deposits and are associated with operating labor contracts.

⁸ See Paes de Barros, Corseuil and Bahia (1999) for a complete account of these constitutional changes to labor regulation.

⁹ Temporary workers get a contribution of 2%. The severance penalty for dismissal for unjust cause is waived for temporary employees.

- Inactive Accounts are those that do not receive regular deposits because of the termination of the labor contract under which they were established.

The regulatory organ of the system is the "Conselho Curador", which consists of two employer representatives, two employee representatives and six government officials from various ministries. Its main function is to decide the allocation of the resources. The Ministry of Planification (MPO, Ministerio do Planejamento e Orcamento) is the supervisor of the program and the CEF (Caixa Economica Federal) operates the fund. The Caixa also keeps a register of historic accounts to facilitate worker's information on all of his labor history.

Table 3. FGTS, Number and Value of Accounts

	Active Accounts			Inactive Accounts		
	Amount (Th.)	Value (Mill. BRL)	Avge Balance (BRL)	Amount (Th.)	Value (Mill. BRL)	Avge Balance (BRL)
1999	48,005	63,286	-	17,858	2,623	-
2000	54,271	67,121	1,237	9,379	1,316	140
2001	59,156	73,767	1,247	9,584	1,338	140
2002	63,632	80,799	1,270	4,976	757	152
2004	55,184	99,277	1,799	646.8	350.0	541
2006	55,043	125,765	2,285	15,088	3,854	255

Source: FGTS Prestação de Contas Exercício 2001, 2000; Relatório de Gestão (2002, 2004, 2006)
1 BRL = 0.6133 USD

Table 3 shows the evolution of the number, value and average balance of accounts with a positive balance. The number of active accounts increased by 15% between 1999 and 2006, while the value of these accounts almost doubled during the same time period. The average balance in 2006 was 2,285 Brazil Reais (BRL), approximately 1,400 US\$.

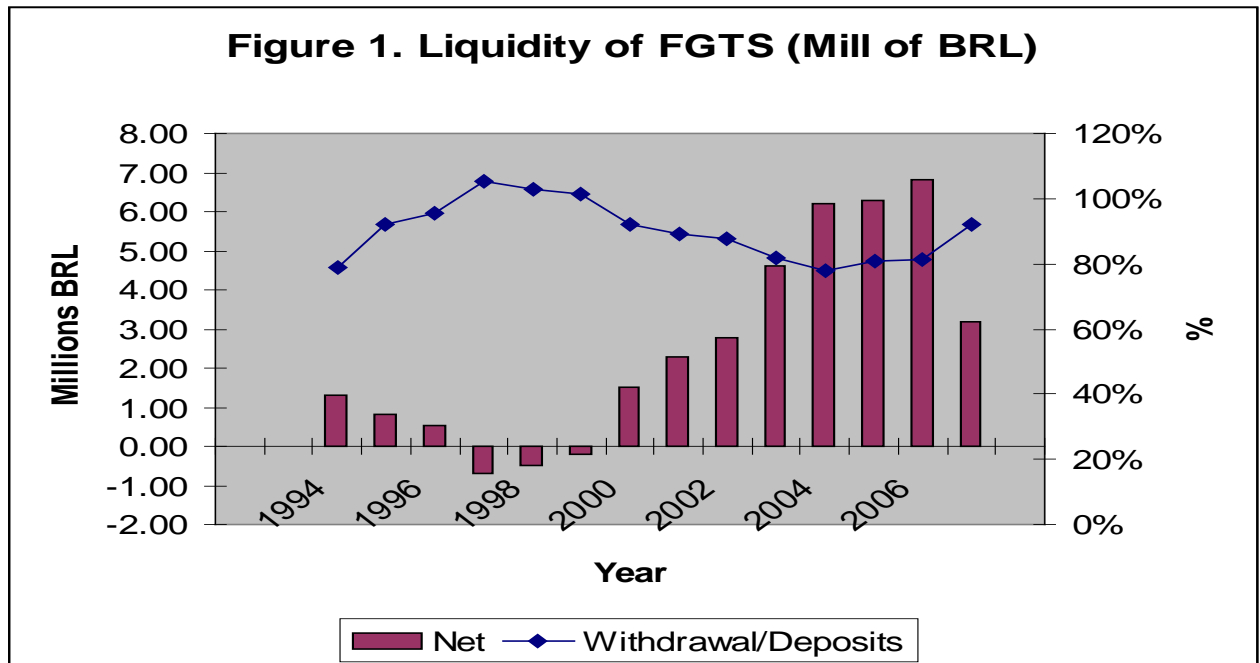

Upon dismissal without just cause, the worker can access 100% of the fund including any portion accumulated from previous jobs. However, the worker can also access the fund under the following circumstances:

- Indirect dismissal¹⁰
- Break-down of contract for reciprocal causes, unavoidable causes, or firm closure
- Termination of the labor contract
- Retirement (individuals older than 70 years of age have automatic access to the Fund), death, disability and specific health issues
- Inactive account for more than 3 years (unemployed or out of the labor force)
- House acquisition or financing of mortgage payments.

Withdrawals for dismissal constitute around two-thirds of all fund removals, while housing withdrawals are approximately 15%. The composition of withdrawals has remained stable between 1999 and 2002, with a slight increase in the value of withdrawals associated with dismissals and a decline in the value of the withdrawals to finance the purchase of a house. The Fund itself has been very active in the financing of housing or home improvement.

Between 1997 and 1999, the Fund experienced liquidity issues (see Figure 1). Part of it could be attributed to the rising unemployment rate experienced at the end of the decade. The year 2000 saw the beginning of a recovery that continued through the decade, led by the fall of the unemployment rate and the efforts of the Caixa both to recover past credits and to increase the number of accounts.

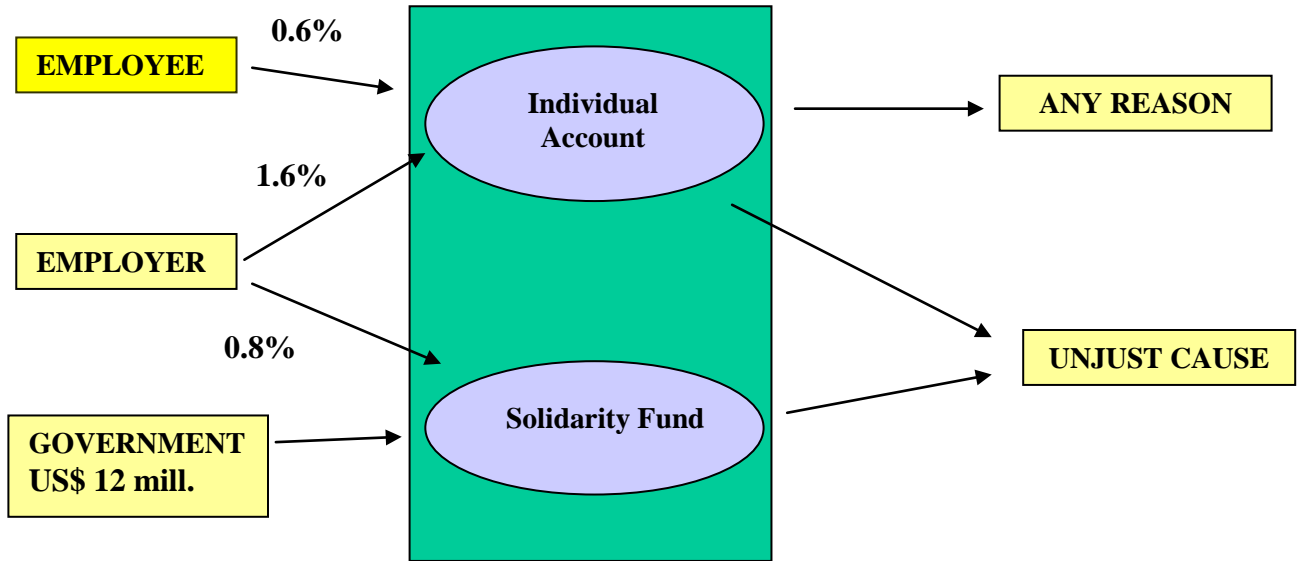

¹⁰ Indirect dismissal refers to court requests initiated by the employee to be dismissed from his job claiming breach of the labor contract.

Chile

Traditionally, unemployment protection in Chile included an unemployment subsidy and severance pay. The first instrument covered workers dismissed for unjust cause and who had 12 months of contributions to any insurance system. This instrument had both low benefits, ranging from 12 to 25% of the minimum wage, over a maximum period of 12 months, and low coverage, 30% of the potential beneficiaries. The second instrument covered workers in the event of dismissal for economic reasons. The benefits were one month of wages per year of tenure with an alternative severance payment that could be negotiated after six years of tenure. This form of severance pay was closer in spirit to a UISA system but it covered only a small fraction of unemployed workers. In particular, it did not cover dismissal for reasons other than economic, including retirement, death, and voluntary quits. In addition, since 1991, a system of individual accounts has also been in place for domestic workers (Chilean Labour Code, art. 163-165). Dismissal for any reason entitled domestic workers to a severance payment for the value of the accumulated fund. Employers contributed 4.11% of the monthly wage to the domestic worker fund for a maximum of eleven years.

Figure 2. Financing of the Chilean Unemployment System

Since 2002, Chile has a new system of unemployment protection. The law regulating the current Chilean unemployment protection system was approved in 2001. The new system is based on a mixture of individual and public funds, funded by contributions from the employer, the employee and the government (See Figure 1). The system covers all dependent workers, except domestic workers, apprentices, retired or minors. The funding comes from contributions from employees (0.6% of the average monthly remuneration over the last 12 months, with a ceiling around US\$2,000 monthly) and employers (2.4% of the average monthly remuneration over the last 12 months, with a ceiling around US\$2,000 monthly). The employee contributions are limited to 132 months in each employment.¹¹ The employer contributions can be deducted from payment of compensation for unjust or economic dismissal. The employer deducts and deposits employee's contributions plus part of his contribution (1.6% of monthly remuneration) in an "Individual Unemployment Account". There are penalties for failure to comply. The rest of the employer contribution (0.8%) is deposited in a Solidary or Common Unemployment Fund. The Government contributes to the Solidary Fund with an annually fixed amount of around US \$8.8 million. In

¹¹ Term or temporary workers do not have to incur personal contributions. The employer will cover 3% of the remuneration. These workers will withdraw all funds at the term of the contract.

case of unemployment, the individual will receive unemployment insurance from his individual account. Any reason for unemployment is valid, including dismissal for economic reasons, retirement, disability or voluntary quitting. This is notwithstanding other compensations the worker may have a right to such as severance payments. The main characteristics of the payments are:

- Limited payments
- Decreasing benefits with ceilings and minimum benefits
- Requires at least 12 contributions before accessing any benefits.
- Benefits indexed annually.

The length of the benefits depends on the worker's contributions, specifically one month of benefits for each 12 months of contributions, to a maximum of five months. In the case of voluntary or involuntary unemployment, withdrawals occur for up to 5 months, with the amount of benefits decreasing in time and the initial amount depending on the number of years of previous contributions. These payments stop if the individual initiates a new contract. The final withdrawal is for the balance in the individual's account. In the event of death, disability or retirement, withdrawals are for the balance. This system is in place for new contracts (after October 2001), but workers with previous contracts have the option to join.

An important feature of the new system is that it guarantees a minimum amount of unemployment insurance (as defined by the table below) for workers with low income that have not accumulated enough resources in the individual accounts. To this effect, 0.8% of the employer contributions are deposited in a Solidary or Common Fund. Unemployed workers that satisfy the requirements (minimum contributions and involuntary unemployment) and have insufficient funds in their account can withdraw from the Common Fund. Payments stop if the worker is not actively looking for employment or rejects (without justified cause) employment with a wage 50% or more of his last wage. Payments from the Common Fund are a decreasing percentage of the average wage in the previous 12 months, with a minimum and a maximum amount, both decreasing in the length of unemployment. Individual withdrawals from this fund are limited to 2 every 5 years. Total withdrawals from the Common Fund are limited to 80% of the last monthly balance.

Table 4. Payments of the Chilean Unemployment Insurance

Unemployment Duration (months)	Minimum (CLP)	Benefits (% average 12 monthly wages)	Maximum (CLP)
1°	65,000	50%	125,000
2°	54,000	45%	112,500
3°	46,000	40%	100,000
4°	38,500	35%	87,500
5°	30,000	30%	75,000

The administration of the funds is controlled by the Unemployment Fund Administrator (AFC). This entity won the management of the unemployment funds in public auctions for ten years. The seven existing pension funds administrators in Chile own the AFC. They are monitored by the Superintendence of the Pension Fund Administrators. The AFC is responsible for collecting and assigning the contributions to the Individual Accounts and the Common Fund, payment of benefits, investment of resources and customer services. The investment structure is regulated according to the norms that rule investments of Pension Funds. The AFC charges an annual commission of 0.6% on the funds balance (Acevedo, Eskenazi and Pages, 2006).¹²

The new Chilean unemployment protection system combines various features of individual accounts programs with more traditional ones. First, it facilitates worker mobility and job matching because it offers protection from all forms of unemployment, including voluntary unemployment, retirement, disability, and death. This way the worker does not renounce better employment opportunities because of fear of losing previously accumulated benefits. Second, the system reduces the moral hazard problems typically associated with the

¹² On August 2008, a new "Proyecto de Ley" modified the Chilean Unemployment Fund to increase coverage and introduce more flexibility in terms of requisites to access the funds. In addition the new Law allows for more flexibility in the administration of the Funds with view to increase its returns propia.

existence of unemployment insurance since the worker has to deplete his/her own resources before being able to access the Common Fund. Moreover, there are important restrictions that limit the access to this fund, as well as additional requirements regarding cause of unemployment and availability to work. At the same time, the system still offers some social insurance to workers with low income who may not have accumulated sufficient resources. Sehnbruch (2004) suggests that although the new system does offer better coverage than the previous system, it does not particularly benefit those in more need of income protection (those holding irregular, short term jobs). However, the Fund has been very successful. By the end of 2007, more than 5 million Chilean workers have joined the new insurance system (See Table 6). Of these, 40% are young workers (between 18 and 30 years of age), 48% are prime age workers (between 31 and 50 years of age) and 12% are mature workers. The value of the fund as of December 2007 is estimated over 1,6 billion US\$, of which the Solidarity Fund accounts for 22%, almost doubling its participation since 2003. Moreover, in terms of the stability of contributions, around 60% of the affiliates hold indefinite work contracts. Therefore, the evolution of the Fund so far strengthens its role as a source of social insurance. The real interest rate has stayed around 3% during 2002.

Colombia

The Law 50 of 1990 introduced several reforms to the Colombian Labor Code. One of these involved switching from a traditional system of severance payments to one that required the creation of individual reserve funds. The traditional system had several disadvantages. The employer handled the severance fund on which he was required to offer an annual interest rate of 12%. However, since the employer was not required to generate or maintain enough reserves for the event of group dismissals, it was often the case that there were insufficient funds to make the severance payments. Under the new system, the employer deposits into the individual reserve fund an amount equivalent to one month of salary per year of work (9.3% of the annual salary). Payment must be settled annually and the fine for those employers who fail to comply with the regulation is equivalent to 12% of the severance payment. Workers with contracts under the previous legislation could switch to the new system.

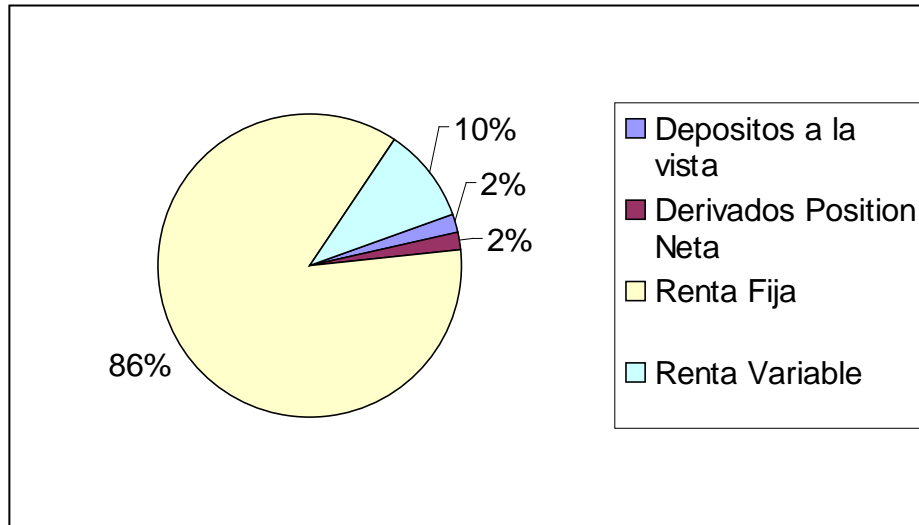

Withdrawals for the total amount in the fund are made upon termination of the contract or retirement. In addition, partial withdrawals are allowed under the following circumstances:

- To finance their education or that of a family member. In this case the necessary amount will be deposited directly by the SAFC into the educational institution.
- To acquire, improve or release mortgage of a house.
- To pay the affiliate's valuation property tax.
- The funds can also be pledged to guarantee house loans granted by worker's funds and cooperatives.

The workers may choose any of the existing Sociedades Administradoras de los Fondos de Cesantia (SAFC) or Severance Pay Funds Administrators as depositary of their funds. These are financial institutions, supervised by the Banking Superintendence, whose exclusive purpose is the administration and handling of severance pay. The SAFC's charge 4% commission for expenses and are required to maintain a solvency margin and to guarantee a return of at least the average return on 3-month treasury bonds. These SAFC are monitored by the Juntas Directivas, which have representatives of both the workers and

employers. Investments must be made in accordance with the conditions and limits established by the Banking Superintendence (see Figure 3).

Fig 3. Colombian Severance Pay Fund. Distribution of Portfolio

SOURCE: Informes de Coyuntura. Boletín Mensual Superintendencia Bancaria. Colombia

At the end of 2007, almost 4 million workers belonged to the fund. This number has been steadily increasing over the first decade, remaining around 4 million since 2004. Most of the workers affiliated to the Fund (70%) earn less than two times the minimum wage. The value of the Severance Pay Fund has been increasing over the last several years. Contributions rose considerably during 2002. This was interpreted as a sign of the recovery of the labor market in Colombia, particularly the formal sector. In general, withdrawals are greater than new deposits. However, the liquidity of the fund has not been compromised thanks to the payment of the returns, the sum of new deposits plus returns always being slightly larger than the amount of withdrawals. The positive returns of the Fund encourage voluntary participation.¹³ The real interest rate has stayed around 3% during 2002, while the nominal rates of return for the Colombian Fund have been declining since 1995. (See Table 6)

Table 6. Evolution of the Colombian Fund

	Value of the Fund (Millions of COP)	Contributors		2 year return

Ecuador

Since November of 2001, Ecuador has a new Social Security Law. The Law regulates a comprehensive social insurance, Mandatory General Insurance (SGO). The SGO includes health, disability, retirement and death, with special provisions for rural/agricultural communities. Contributions to the SGO vary by economic sector, but for most workers amounts to 20.5% of the monthly wage (11.15% from the employer and 9.35% from the employees).

The regulatory organ of the General Insurance is the Instituto Ecuatoriano de Seguridad Social (IESS). It collects the contributions and controls compliance with the law in matters of social security. Within the SGO, there are two varieties of unemployment insurance program. Individuals 40 years of age or younger (and those between 40 and 49 that choose to register), and new workers are covered by the new individual account system.

¹³ During the last year they seem to have experienced some difficulty. Nevertheless, returns are always over the minimum set up by the Banking Superintendence.

Other workers are covered under the old system of intergenerational insurance. The employer contributes with the equivalent of one month's wages per year to an individual account or "Fondo de Reserva" (Reserve Fund). Workers with more than one year of tenure and who are (involuntarily) unemployed have a right to income protection in case of involuntary unemployment. The worker must have a balance equivalent to 48 monthly contributions in the individual account. The amount available is three times the regular monthly wage (averaged over the previous year). In case of retirement, disability or death, the balance accumulated in the individual account will be fully accessible to the workers or his/her inheritors. Workers that are not covered under this program can draw UI benefits under the previous law.¹⁴

Mandatory savings funds are administered by Provisional Savings Managing Institutions (EDAP's) under the supervision of the Banking Superintendence. The EDAP's also administer the individual Reserve Fund and can offer loans against the amount in the individual Reserve Fund. In 2003 there were around 1.2 million affiliated workers, half of these under fifty years of age. The latest report from the Banking Superintendency, values the unemployment fund at 1.4 billion \$, with a rate of return of 7.5%.

Panama

Workers in Panama are entitled to a severance payment of one week's wages per year worked, payable at the end of the labor contract. The employer also has to offer the worker compensation in the case of dismissal without just cause, if the worker leaves the job for justified causes (included economic reasons) or if the labor contract ends of mutual accord. This compensation varies with the worker's tenure according to the scale provided below.

Prior to 1972, the Labor Code established that these payments were a liability of the firm, but it left the management of it to the employer. This created the usual moral hazard problem for the firms described above, leading to bankruptcy and liquidity problems in the

¹⁴ Those workers access a common fund in the event of unemployment if they have a minimum of 60 non-consecutive contributions to the SGO and after a waiting period of 90 days

case of substantial dismissals. After the new Labor Code became effective in 1972, the employer is required to deposit each trimester the corresponding fraction of the worker's severance payment, plus 5% of the corresponding amount he would collect in the case the contract terminates, in a trust fund with a private financial institution (slightly over 80% of the unemployment fund). Therefore, this part of the fund constitutes a system of individual unemployment accounts, in the sense that the amount is locked in for the workers and cannot be used by the employer. In addition, the worker may make individual contributions to the fund, deposited in a private account, but these are not a substantial part of the fund. The fund can be used as a guarantee for loans destined for the purchase of a house.

More than 20 years	7 months		

Source: Panama's Labor Code (1972)

There is no particular institution in charge of managing the severance pay. The employer establishes the trust fund with an approved financial institution of his/her choice. Banks, insurance companies, law firms, and other types of firms can apply to become a depository of these unemployment funds/trusts, although the majority of them, around 60%, are banks. However, other types of firms serve most of the workers. The financial institutions in charge of the unemployment trusts offer the market rate of return on the funds; Figure 4

shows the evolution of the rate of returns on the funds help by each type of management firm.

Figure 4. Rentability of Panama's Unemployment Fund.

Peru

In Peru significant labor reforms started in 1991. Prior to this date, the Peruvian Labor Code established a very rigid labor market. What used to be a tenure bonus became the CTS (Compensacion por Tiempo de Servicio, Decreto Legislativo n.650). The text of the Law establishes the CTS as an individual fund to be financed by the employer with a deposit equivalent to 0.5 of the monthly salary payable every six months (deposited in May and December). The system only covers private employees not covered by other special regimes. The worker can choose the financial institution where he wants his fund deposited. Employers and employees can make private arrangements under which the employer becomes responsible for the deposit.

In general, withdrawal of the funds requires proof of dismissal. Originally, however, workers could withdraw 50% of the funds in the case of an emergency. They could also use up to 50% of the funds as guarantee of employer's loans or loans from credit unions and savings cooperatives. Nevertheless, the government has authorized additional withdrawals on occasion. For instance, last December, through a Decreto de Urgencia 67-2002, the government authorized the withdrawal of 100% of the funds to cancel loans and debts incurred with financial institutions. Earlier that year, the Decreto de Urgencia 19-2002 had allowed workers to withdraw the full amount of the deposit made between May and October 2002 to "stimulate domestic demand". These allowances have continued during 2003 and 2004 and ended in January 2005.

According to the Banking Superintendence, on December 2007, there were over two million CTS deposits valued at 4,769 thousand Peruvian soles (around 1,615 million US\$). Most of these accounts (98%) are small - for amounts less than 20,000 Peruvian soles - representing only 54% of the value of the fund. The majority of the deposits are within the banking system (93%) while the rest are deposited in Savings Cooperatives. Deposits into the savings cooperatives grew at a much faster rate than deposits into the banking system due to the payment of higher interest rates.^{15 16}

¹⁵ The CTS amounts deposited in the banking system rose by 3% over the last year, whereas CTS amounts deposited with municipal savings cooperatives rose by 80%. Association Peruana de Consumidores y Usuarios. Boletín de Noticias, August 29, 2008. <http://www.aspec.org.pe/>

Uruguay

Although, strictly speaking, Uruguay does not have a system of individual accounts for unemployment insurance purposes, we will briefly refer to it because they have the necessary infrastructure (individual accounts) to implement such a system with relative ease. As in Ecuador, the Banco de Prevision Social administers a comprehensive social insurance program that includes medical, life, retirement, disability and unemployment. Approximately one half (7.47%) of the total employee contributions (15%) is deposited in a private account. Employers contribute an additional 12.5% of payroll and the government finances any deficit from tax revenue. This individual account can only be accessed in the event of retirement, permanent/transitory disability or death. The current unemployment protection system in Uruguay, however, does not rely on this comprehensive insurance scheme, but on a traditional UI system.¹⁷

Venezuela

Venezuela's Labor Code dates from 1997. Workers (after 3 months of service) have the right to a severance package equivalent to 5 days of pay per month worked. There is an additional 2 days of pay per year after the first year up to a maximum of 30 days. The worker may choose one of the following three forms of receiving the severance fund: either as an individual account, as an individual trust fund, or as an individual account registered in the firm's accounting records. The employer makes monthly deposits into the selected type of account. The return on the trust funds or individual accounts deposited in financial institutions is the market rate. For funds deposited with the firm, the employer has to pay the average rate established by the Central Bank. If the employer fails to make these deposits (to

¹⁶ Banks pay, on average 4,5% (on accounts held in soles) or 2.29% (on accounts held in dólares), whereas savings cooperatives pay 11% (on accounts held in soles) y 4.5% (on accounts held in dólares). La Republica – on line August 29, 2008 <http://www.larepublica.com.pe/content/view/220336/484/>

¹⁷ UI in Uruguay covers employees from the private sector who had been (formally) employed for at least 6 months during the 12 months prior to becoming unemployed. For workers receiving daily or hourly wages, the requirement is to compute 150 of these wages or 6 minimum wages during the period. Qualified unemployed workers receive 50% of the average (over the last six months) monthly wages for a maximum period of six months. Refusal of available work without legitimate cause ends unemployment assistance.

deposit the funds as requested by the employee), he has to pay a rate on the amount owed (not deposited as requested) determined by the Central Bank.

The fund is available to the worker upon termination of the contract, although access is granted to the annual returns yielded by the deposit. The worker has also the right to advance notification of dismissal, ranging from one week (after one month's tenure) to 1 month (after one year's tenure). If the employer omits the advance notification, he will pay the corresponding amount of salary at the time of dismissal.

As it is often the case with other UISA systems, partial withdrawals are allowed to finance certain investments. In this case, an employee can obtain a loan of up to 75% of his/her severance fund to pay for the purchase or financing of a home, his/her education or that of a family member or the individual's or the family's health expenses.

Performance of UISA's

This section highlights some issues that have arisen in the context of different countries' individual experiences with UISA's.

In countries where the system has been in place long enough to observe meaningful trends, the performance of the funds has been volatile, reflecting the instability of Latin American financial markets. This problem has been particularly acute in Brazil. The FGTS has been poorly managed by the government. Initially, the government guaranteed an interest rate on the accumulated funds to maintain the real value of the Fund. These interest rates were dependent on the length of the labor relationship and varied from 3% for employees with tenure of less than two years, to 6% for employees with more than ten years of tenure. During the 1970's various regulations influenced these interest rates, which were finally reduced to 3% for all deposits initiated after 1970. These changes complicate the calculation of the return on individual deposits, since deposits made at different times and for individuals with different tenures will have different associated interest rates. Exploration of the returns on the deposits involves two main issues. On the one hand, hyperinflation has made it difficult to maintain the real value of the funds. The biggest real losses occurred between 1968 and 1979, when deposits initiated with a nominal interest rate of 3% depreciated over

40%. Only during the first half of the 1990's were the returns on FGTS accounts enough to compensate for inflation for all account types. On the other hand, the rate of return on the fund also compares poorly with alternative assets. Because the deposits to the Fund constitute a form of forced savings, the returns on these deposits should be compared to those of alternative saving instruments, namely saving accounts. Again, only recent deposits (those initiated between 1995 and 1998) have experienced a gain relative to saving accounts (Oliveira, Beltrao, Pasinato and Guerra, 1999).

In other countries, like Colombia, the performance of the Severance Fund has been steadily improving over the 1990s. However, with the exception of Brazil, there are no studies comparing the returns on UISA's with other financial assets.

An additional problem arising from poor fund management and low rates of return on deposits is that, in the presence of liquidity constraints, it creates strong incentives for the worker to try to access the fund. Barros, Corseuil and Foguel (1999) provide some evidence of the existence of collusive behavior between workers and firms to "label" voluntary quits as dismissals.¹⁸ In general, these incentives will create higher rates of turnover in the labor market than would otherwise be observed. It is difficult to assess to what extent this is a problem arising from the particular characteristics of the Brazilian Fund or the general performance of the economy or a combination of both. One plausible reason could be that Brazil is the only country, among those offering the unemployment insurance individual savings account system, which makes payment contingent on the type of dismissal, thus creating incentives for this type of collusive behaviour. Yet, the existing structure of the penalty for unjust dismissal in Brazil may be an element affecting (or reinforcing) these incentives. Another possibility is that Brazilian workers may have faced particularly severe credit constraints and therefore had particularly powerful incentives to engage in this collusive behaviour. Yet another explanation involves the poor management of the fund, which earned negative real returns for considerable periods of time. Most likely a combination of all of the above shaped this particular effect of unemployment insurance

¹⁸ The firm dismisses the worker, granting him access to the funds, and the worker renounces the penalty. This type of collusive behavior has become more difficult with the creation of additional penalties for firms in the case of dismissal without just cause, which have to be paid to a common pool and therefore, cannot be "returned" by the employee.

individual savings accounts in Brazil. Therefore, to draw the conclusion that this type of collusion will not persist if, for instance, the fund were made accessible to the worker upon any type of separation might not be correct. Moreover, some of these problems might have different effects in different countries. For instance, credit constraints may generate enough political pressure for the government to allow additional withdrawals from the fund for reasons other than unemployment, as it is the case in Peru.

Studies regarding the Brazilian case show that regarding the adequacy of income protection, UISA's do not fare well. Relative to the minimum monthly wage, the distribution of the balances shown in Table 3 reveals that 56% of the active accounts have balances that are less than the minimum wage, while 1.5% of the active accounts have balances that exceed one hundred times the minimum wage (around 38% of the total balance of active accounts).¹⁹ Furthermore, although the fund is the most important source of income protection for unemployed workers, particularly those with some tenure, the breadth of the coverage -- in particular the coverage of the low-income population -- is not high. The majority of the FGTS' beneficiaries are above the 50-th percentile of the income distribution (Barros, Courseil and Foguel (2001)). This could be a consequence of the combination of poor performance of the Funds mentioned above that forces workers to try to access their accounts as often as possible to avoid important losses in the purchasing power of their savings.

Moving from a system of severance pay to a system of individual accounts is relatively easy in terms of the necessary administrative infrastructure, as the Panama case showed. However, this change highlighted an additional issue that has received some attention in the literature on UISA's, namely that such moving may have an effect on wages. In particular, it opens the possibility that workers and firms respond to the new system by negotiating lower wages to compensate for the distortionary effects of severance pay regulation. This was not possible under the traditional system because of the firm's moral hazard problem. Kugler (2001) finds evidence suggesting that this is indeed the case. At the same time, Kugler's results suggest that the insurance role of the new severance payment

¹⁹ See Carneiro (2003), Barros, Courseil and Foguel (2001)

system is very limited and that the individual account system has important effects in increasing turnover rates.

The revision of the UISA systems that exist in Latin America reveal that, in general, they increase the flexibility of the labour market without imposing the same high administrative costs and moral hazard problems of traditional Unemployment Insurance systems. The study of individual cases also shows, however, that they pose problems of their own. On of the most important is that they do not seem to be a good source of unemployment protection in the presence of severe liquidity constraints or deficient financial management.

3. Conclusion

This paper provides an overview and assessment of the basic features of UISAs in Latin America. Unemployment insurance saving accounts provide an alternative to traditional systems of unemployment insurance, one that seems particularly suitable for developing countries. Their main potential advantages are:

- UISA's reduce the moral hazard problems associated with the traditional systems, both on the part of the worker and on the part of the firm. They provide the adequate incentives for workers to return to work and for firms to comply with the payments for dismissal.
- UISA's have the potential to promote flexibility in the labour market (it facilitates worker mobility and job matching).
- A system of individual accounts is, in principle, less expensive to implement than unemployment insurance. In addition the transition from most of the actual systems of severance payment seems relatively easy in terms of infrastructure.
- A major caveat is that it is not yet well understood whether or not these programs offer adequate income protection. Evidence suggests that this form of income protection for the unemployed should be complemented with additional forms of insurance.

The main conclusion from this study is that UISAs seem particularly well suited for developing economies and economies in transition, but with the understanding that assessment of its effects ought to be guided by country specific studies. A key lesson learned

from examination of the existent UISAs in Latin America is that any assessment of its effects requires careful country specific analysis. Even when the model implemented in most countries has the same basic features, namely a system of unemployment insurance premiums regularly deposited into individual accounts, it is difficult to extract general conclusions as to its consequences for labour markets. This may be partly because of small differences in implementation, but it may also be due to each country's idiosyncrasies.

In identifying the direction of further research, the particular political and institutional environment of the countries should be taken into account. Ideally, we seek to understand whether differences across countries in the outcomes of UISAs are due to differences in program design and implementation or due to differences in the economies and institutions of these countries. Individual country studies therefore, will enable us to see if any general patterns emerge. In addition, despite researcher's efforts, data are not very comparable across countries, which makes country-specific research more effective than cross-country studies.

One of the most pressing matters for research is the ability of UISAs to provide adequate income protection. For some countries, where the extent of the informal or "underground" economy is abnormally large, this implies paying particular attention to the effects of UISAs on the creation of formal employment or to the potential that exists for the administrators of the fund to extract rents from either employers or employees. For other countries, this may be a lesser issue. Other matters, such as ascertaining whether UISAs are contributing to increasing inequality by eliminating the role of social insurance in protecting against unemployment risk, might be more relevant for them. In any of these cases, we ought to consider the alternative income protection programs that are available in each country.

Additionally, the labor market effects of implementing UISA's should be more thoroughly examined. Particularly important, although a difficult task by nature, is to understand the effects of UISA's on the extent of the informal economy. In addition, the problem of collusive behavior between firms and workers to reduce wages should be considered.

One of the objectives of this paper is to summarize the basic features of UISA systems and examine evidence relating to the performance of these arrangements. This type of assessment can help to identify desirable directions for reform. While such identification may be necessary to bring about change, it is typically not sufficient. Political constraints often make it difficult to move in the desired directions, even when there is general agreement on the problems associated with the current system.

Overall, UISAs have the potential of overcoming some of the worst features of traditional systems of unemployment protection, reducing moral hazard, lowering administrative costs (with respect to unemployment insurance), reducing firing costs and avoiding firms' liquidity issues (with respect to severance payments). Theoretically, they are also likely to promote formal labor markets. However, the system needs to be upgraded with additional features if it is to provide adequate coverage. This, in turn, may limit the advantages mentioned before. The overall effect of UISAs, thus, depends on a vast array of specific country characteristics and program parameters. This calls for individualized studies that address the particularities of each country when assessing or evaluating the performance of UISAs.

Summary Findings

The unemployment protection systems that exist in most Latin American economies are generally considered inadequate in terms of providing insurance to workers. They may also encourage stratified labor markets and impose barriers to the employee's mobility and the firm's adjustment to changing labor market conditions. In addition, some of these systems involve high administrative and monitoring costs and may create additional adverse effects that induce higher unemployment rates and longer duration of unemployment and promote informal labor markets. Recently, research effort and policy interest has turned to Unemployment Insurance Savings Accounts (UISAs) as an alternative to traditional systems of unemployment insurance. UISAs are schemes of individual mandatory savings. Therefore, they smooth income over an individual's life cycle time rather than pooling unemployment risk over the total working population at a point in time. This form of unemployment insurance diminishes the moral hazard problems associated with traditional insurance methods. However, it presents problems of its own. First, it is questionable that these systems provide adequate protection against unemployment risk. Additionally, their effects on the promotion of informal labor markets and their administrative costs are yet to be determined. Finally, the effectiveness as a form of unemployment insurance depends critically upon the performance and credibility of the financial institutions managing the funds. This paper examines the experience of Latin American countries that use UISAs, with the hope of highlighting the problems of the system and identifying areas for future theoretical and empirical work. In conclusion, the overall effect of UISAs depends on a vast array of specific country characteristics and program parameters. The way the system is implemented, existing labor regulation, the extent of the informal economy and the scope for collusive behavior greatly influence the success of these programs. This calls for a more extensive research effort in the area.
